Project Description: Smart University Laboratory Equipment Monitoring and Allocation System using C.

The **Equipment Management module** is responsible for adding, displaying, updating, searching, and sorting laboratory equipment records. The module allows users to enter equipment details and validates important values such as total quantity, available units, and usage count. Equipment can be searched using ID, category, laboratory, or condition. The sorting facility organizes records based on name, available units, usage count, category, or laboratory. Recursive searching is also implemented for finding equipment by ID. This module provides a structured and organized method for maintaining laboratory equipment information.
